

## About the SWR Meter RC Antenna Meter

### Description:

This "RC Hobby" grade SWR meter measures forward and reflected waves to determine the working efficiency of an antenna.

The meter can be used to run a full scan from 5.645Ghz to 5.945Ghz to indicate the working efficiency (SWR value) and centre frequency of an antenna. An optimised antenna will significantly extend the working range of the antenna and minimise signal loss in complex terrain. When the SWR value is 1.0, it means that the high-frequency energy has been transmitted 100%, with no loss of energy reflection.
